User

Read the README.md file and help me complete all the tasks. Now help with Task 1.

Assistant

I read the README and identified Task 1: safely handle empty submissions without a parsing crash or using an attempt.

Assistant

Implemented an early empty-input guard in game_engine.py. Empty submissions show a warning and return without parsing or incrementing attempts.

User

Help me perform Task 2.

Assistant

Added possible-range tracking, narrowed the range after valid low or high guesses, reset it to 1-100 on a new game, and rejected guesses outside the current range without consuming an attempt.

User

Help me with Task 3.

Assistant

Added a recent guesses panel showing the five most recent valid guesses, with color-coded TOO LOW, TOO HIGH, or CORRECT results. The panel clears on reset.

User

Help me perform Task 4.

Assistant

Added a 10-valid-guess limit. If the player runs out of guesses, the game shows a GAME OVER message with the secret number. Pressing R starts a new game after either a win or loss.

User

Help me create a PDF for the chat and the link for the chat according to README.md.
